

## **Should we fear an Artificial Intelligence? „Artificial Intelligence”**

The world of both robotics and artificial intelligence is developing extremely quickly. It can be dangerous, but at the same time it is in our favor. All this is based on the hypothesis that the basic human quality, such as intelligence, can be so precisely described as to be machine-generated.

According to Stephen Hawking, people who are good at programming computer viruses could ultimately create artificial intelligence. It is likely that it will improve and reproduce to such an extent that it surpasses human abilities. In short, replace the person. . This can happen if scientists and computer engineers continue to confuse and break into the sphere of robotics and artificial intelligence. As useful at the moment it can be very dangerous. For the simple reason that as we all know, the robot with built-in artificial intelligence can be studied and felt by itself, it will become more sinister and unprecedented for us. After all, there is no big difference between what can be achieved through the biological brain and a computer. Of course, every artificial intelligence needs time and time to learn the main priorities and knowledge of man. There is no way that a hypothetical intelligence emerges to be hundreds, even a thousand times clearer than the human being, and will be able to decide for itself what is right and what is not. It will also be autonomous in its decisions. According the Ray Kurzviale, computer power at some point in the future can be intelligence must interact and learn from the environment before it becomes over-intelligent.

Self-drive vehicles, even smarter smartphones and connecting buildings - all benefit man. Helping robots of the elderly and sick people is of great importance to mankind. Inventing more secure homes by artificial intelligence. Everything created by artificial intelligence is a great benefit to man. In each school, children will be able to learn only from computers with artificial intelligence. In restaurants, bookings will only be done through a computer or on-site through a dashboard. Mothers will no longer worry about their young children as soon as they have a robot that takes care of them while their parents dissolve. Of course there is a bad side. Expanding and enhancing artificial intelligence robots makes everyone panic, and this causes machine control over the world. All agricultural activity such as digging the fields, sowing all sorts of fruits and vegetables and spraying the field with a preparation will now be done entirely by robots. For the simple reason that each of us would like a light job. Scientists and computer engineers are making every effort to make us easier and more comfortable with us. The distance and the area of land you have to process will be much faster and easier than the robots. There will be no air pollution from the fuel smoke of all the agricultural machinery we use today.

Everything has its bad and positive qualities. Robots can be both good and bad. “We have to be careful of any intellect”, says Stephen Hawking.
